Eve
Home

Smart charging. Simply taken care of.

Easier installation. Smarter everyday charging

www.alfen.com

Home charging should be straightforward — for the people who install it and the people who use it.

Eve Home brings the charger, installation tools, everyday app and service together. Eve Install supports commissioning, while Eve Connect provides everyday charging control.

Easy from the start

Straightforward installation. Guided setup

The dock simplifies mounting and connecting the charger. A compatible smart meter connects directly through Eve Home's built-in P1 connection, without an additional interface module — fewer separate components for the installer to install.

With Eve Install, the installer connects wirelessly and follows a guided setup process on a smartphone. Step-by-step guidance helps them work through the settings in a consistent way, without a laptop.

Flexible everyday charging

Schedules, solar choices and insight

With Eve Connect, home users can set schedules and view charging history in one place. If an electricity tariff is cheaper at certain times, scheduling can help take advantage of those periods.

For homes with solar panels, charging can use available solar power or a combination of solar and grid electricity.* Users choose how solar charging fits their needs. Charging records can also be exported when reimbursement is needed.

* Not all features are available at launch. Availability depends on the software, vehicle, home installation and selected options. Some functions require later software updates or additional licences. Visit alfen.com for the latest information.

Power that fits the home

Clear charging status at a glance

Active Load Balancing helps the car charge alongside the rest of the home. When household electricity use changes, the charger adjusts the power available for the car to help stay within the connection's capacity.

Eve Home's animated LED interface shows charging information at a glance, without opening the app. Eve Connect provides access to charging settings on a phone.

Ready for what's next

Prepared for smarter energy

Eve Home is designed to gain supported new features through software updates.

Its hardware is prepared for future Plug & Charge, which lets a compatible car identify itself when connected. It is also prepared for future bidirectional charging — using energy from a compatible car to supply a home or feed it back to the grid.*

These functions will depend on the car, home installation, available software and services, and local requirements. Eve Control connects Eve Home to a growing energy ecosystem — for today's smart solutions and tomorrow's innovations.

Service with less disruption

Five-year warranty. On-site cover when connected to Eve Control

Eve Control helps diagnose and resolve issues remotely, reducing site visits and disruption.

Every Eve Home includes a five-year standard warranty. When connected to Eve Control, on-site warranty for covered faults is included. Without Eve Control, swap warranty is included, with the installer carrying out the swap; on-site warranty is available at additional cost. Swap units are refurbished.

Connectivity: LAN or wireless LAN connection. Five-year SIM connectivity is optional.

If the central charging unit needs replacing, it can be swapped on site while the dock and installed cabling remain in place. The customised front cover can also be reused. Eve Install supports the transfer of settings to the replacement unit. Replacing and setting up the unit rather than repairing individual components on site helps limit work at the installation and disruption at home.

For installers

Easier installation and service

Fewer components to install

The dock and built-in P1 connection mean fewer separate components to install.

Get it right first time

Eve Install guides commissioning from your smartphone, helping you work through the settings consistently and prepare the charger for your customer.

Replace the unit. Retain the installation

When you carry out a service swap, replace the central charging unit rather than repair individual components on site. This helps save time on site.

For home users

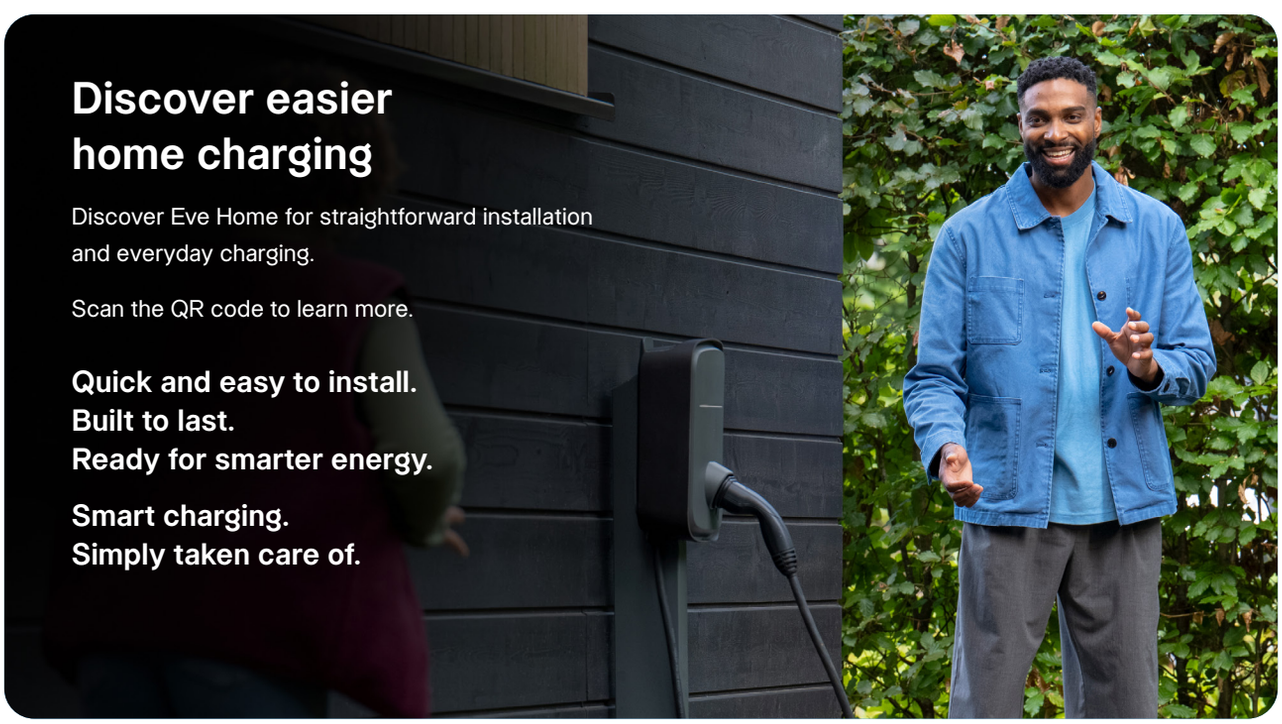

More control. Less hassle

Charge on your terms

Charging schedules help fit charging around daily routines and lower-cost periods, where the tariff allows.

Make more of your solar energy

Choose solar-only charging or combine solar and grid electricity.*
