Cell Therapy Bioprocessing Technologies and Indicators of Technological Convergence

A Concise Review

by David A. Brindley, Anna L. French, Ricardo Baptista, Nick Timmins, Thorsten Adams, Ivan Wall, and Kim Bure

METHODOLOGY, IMPLICATIONS, AND CAVEATS

We compiled a list of key cell therapy bioprocessing technologies through expert-user interviews; reviews of trade and industry literature; and discussions with technology manufacturers. Thereafter, we obtained technical specifications from publicly available documents and (whenever possible) confirmed them with the technology manufacturers (see Acknowledments)to ensure their accuracy.

It was not possible in all cases, however, to make contact with some manufacturers for corroborating publicly available data or obtaining complete data for all technology features sought. Additionally, our data presented are agnostic to performance for particular cell types, are restricted to single-use technologies, and do not reflect the impact of operator skill and/or regulatory restrictions on technology performance. Due to the significant technological heterogeneity in downstream processing technologies, our discussion is restricted to upstream bioprocess technologies concerning cell culture process and media development. We also omitted the impact of cell characterization and testing technologies that may be used alongside those technologies discussed.

Collation of these data clearly demonstrates the convergence of "traditional" biopharmaceutical technologies with the emerging cellular therapies industry. High-level technical specifications are not always easily obtainable. Technology manufacturers are hesitant to definitively state typical operating ranges for reasons of commercial confidentiality. Potential inter–cell-type idiosyncrasies can also make a difference, as well as as-yet limited user experiences and optimization case studies in which cells are the product. In these electronic-only tables, we provide an overview of the most common technologies for rapid and straightforward comparison of available options to guide readers' identification of technologies for further investigation. Online Table 1 below details process and media development options listed in Figure 1 of the accompanying article (1). Online Table 2 below details stirred-tank cell expansion options listed in Figure 1 (1). Online Table 3 (next page) details rocking-motion cell expansion options listed in Figure 1 (1). Online Table 4 (next page) details adherent-cell expansion options listed in Figure 1 (1). And online Table 5 (next page) details other cell expansion options listed in Figure 1 (1).
